Walk-through Energy Audit Form

Adapted by Shirley Thompson from Manitoba Hydro

What is an Energy Audit?

An energy audit is a procedure to identify how energy is being used in a facility and help identify practical and cost effective energy saving measures that will reduce energy use and lower operating costs. Energy audits typically produce energy savings of 10 to 35 %, depending on what energy savings measures have already been under taken. Almost every facility building in Canada can add some energy efficient measures and save energy dollars.

Types of audits

There are several different types of energy audits that are used to help evaluate the potential for energy savings. The two types of energy audits mentioned in this guide are the simple and detailed walk-through audits. The simple walk-through audit also known as the screening audit will highlight the main uses of energy use in the facility and will point out the most evident ways to save energy. The detailed "walk-through" or comprehensive audit, will provide an in-depth analysis of the energy use of a facility and a detailed energy saving implementation plan. The systems that are evaluated include the building envelope, lighting, domestic hot water, heating ventilation and air conditioning (HVAC) and controls. The two other types of energy audits that are often refereed to as the benchmark, bootstrap or yardstick audit and the engineering audit. The engineering audit includes detailed analysis of specific systems within a facility and provides information ranging from general recommendations to detailed engineering plans and costs, depending on the detail required.

Do You Need an Energy Audit to Save Energy?

It is not always necessary to start with a detailed energy audit but conducting your own simple "walk-through" audit will help you identify energy losses which can be corrected at little or no additional costs through maintenance, operational actions, or purchasing choices. If a more detailed technical analysis seems necessary then this initial energy audit will provide the important preliminary data necessary for the more detailed analysis.

Getting Started

Whether you conduct your own simple audit or have a professional conduct a detailed audit for you, the first thing you will need is at least 12 months of energy information (electricity and natural gas, propane or oil). You can get this from your utility company, your fuel supplier or from your energy bills. This information is valuable as it can tell you how much energy is used for baseload equipment such as hot water, lighting and office equipment and how much energy is used for heating and air conditioning. Energy worksheets have been provided in the Facility Building "Walk-Through" energy audit form later in this section. You can record the information on the sheets provided or plot them on graph paper which ever seems best.

The Simple Walkthrough Audit

Obtain a copy of the building plans or a sketch of the layout of each floor, then walk through the facility and identify all the equipment and processes that use or cause the use of energy. You will need lots of time to do this properly so allow yourself at least 4 –5 hours. Make a list of the size and location of all energy using equipment such as motors, appliances and lights. Include information such as operating hours and temperatures, condition of insulation and weather-stripping, locations of gaps around doors and windows etc. To help you identify potential energy reduction measures, ask yourself the following questions.

- Do the lights or equipment need to be on as long as they are?
- Can the operating temperature be reduced?
- Can smaller more efficient equipment be installed?
- Can insulation be added?
- Can windows and doors be improved or should they be replaced?
- Can you Turn it off, Turn it down or Tune it up?

From actual energy audits it has been shown that approximately 80% to 85% of the energy used in a church is used for heating and ventilation. The balance of the energy is used for fans, water heating, lighting, motors, cooking equipment and office equipment.

Typical use of Energy for a small facility building in Northern Ontario/Manitoba

Heating:		Cooling:	Baseload:	
Heating	76.8%	AC 0.8%	Hot Water	2.8%
Ventilation	7.8%		Lighting	4.2%
Car plugs	0.2%		Motors	2.7%
			Pilot Lights	0.02%
			Cooking	1.8%
			Misc. Equipment	3.2%

Facility Building "Walk-Through" Energy Audit Form

Date:_____

The first step in an energy audit is to record all energy consumption from utility bills for the last 12-months. Then walk through the facility and identify all the equipment and processes that use or cause the use of energy. Note size of the equipment, operating hours and temperatures, condition of insulation and weather-stripping, gaps around doors and windows etc. Ask yourself questions such as the following to help you identify potential energy reduction measures: Does the equipment need to run as long? Can the operating temperature be reduced? Can smaller more efficient equipment be installed? Can insulation be added? Can windows and doors be improved or should they be replaced? Can electrical equipment be operated at off-peak hours?

Can you Turn it off, Turn it down or Tune it up?

If a more detailed technical analysis seems necessary then this initial energy audit will provide the important preliminary data necessary for the detailed analysis.

General Information

(Please circle units used where applicable)

Facility Name:_____

Mailing Address:_____

Town:_____ Postal Code:_____

Name of Facility Operator:_____

Title:_____

Phone Number:_____ Fax Number:_____

Name of person completing this form:_____

Title:_____

Phone Number:_____ Fax Number:_____

Brief Description of Function or Use of Facility:_____

_____

_____

Total Floor area of Facility (sq. m./sq. ft.):_____

Facility Building "Walk-Through" Energy Audit Form
Electrical Worksheet

Complete one form for each electric meter in your facility. The completed form is necessary, as part of the information needed to establish your energy usage and Greenhouse Gas (GHG) baselines. This information will also provide you with a much better understanding of what your actual energy costs are.

Facility Name:_____

Meter Descriptor (Entire Facility, Area, Equipment, Etc.): _____

Service - Phase(s): _____ Voltage: _____

Utility Company Name: Kenora Hydro?

Notes

This sheet is provided for those customers who wish to calculate the estimated energy and dollar savings from lighting improvements.

Lighting Energy Saving Calculation Worksheet (Optional)

	Lamp Type	Wattage per Fixture Lamps & Ballasts* (W)		(kW)		Fixture Quantity		Annual Hours of Operation (hrs.)		Energy Usage (kWh)
Existing Lighting System (e.g. T-12, Inc., Merc. Vap. etc.)			/	1000	X		X		=	
A										
Proposed Lighting System (e.g. T-8, CFL, HID etc.)			/	1000	X		X		=	
B										

Total Energy Savings (kWh)	=	
Average Cost per kWh	X	$ 0.045**
Total Energy Savings	=	$

Energy savings = (Existing Total in kWh – Proposed Total in kWh) x Average Cost per kWh.

Notes

* Refer to Nominal Wattage Table Section 3 (page 8) of Application Guide for details (Divide total wattage by 1000 to get kilowatts).
**Contact your Energy Service Coordinator for the average cost that is correct for your facility ($0.045 can be used for an average facility).

Energy Savings may vary depending on the building's heating system and location of lighting.

Guide to Improve Energy efficiency measures for Buildings

Most people know the three R's of recycling – Reduce, Reuse, Recycle, but in terms of saving money on energy bills they stand for:

- **reduce operating time** (lights, gas pilots in summer, ventilation systems turned off when unoccupied, connecting fans to light switches or occupancy sensors)
- **reduce operating temperature** (hot water, refrigerators and freezers, heating systems, ventilation systems
- **reducing operating losses** (drafts, lights, insulation, appliances).

Basically, reduce time, temperature and loses. This checklist provides a list of things to do by area/system.

Building Envelope (reducing losses)

1. Install triple glazed units when repairing frames.
2. Install low emissivity glazing.
3. Install permanent storm windows.
4. Reduce glass area (wall up/close off) on north side.
5. Orient windows to south for heating and lighting.
6. Consider use of daylight through windows.
7. Install solar shading (shades, blinds.
8. Install insulated doors.
9. Install vestibules.
10. Wall up/close off unneeded openings.
11. Install insulation to poorly insulated attics/roofs, ceiling, walls, floor (R20 in walls, R40 in ceilings).
12. Reduce infiltration around doors and windows and through walls
    a) caulk around doors and windows
    b) Add/repair the weather stripping around doors and windows
    c) install inside plastic film on windows
    d) Repair cracks in walls

Heating (operating times and temperatures)

1. Replace inefficient boilers.
2. Use modular units.
3. Decentralize system.
4. Downsize system.
5. Replace inefficient burners.
6. Install automatic flue dampers.

7. Replace pilot lights with electronic ignition.
8. Preheat combustion air/make up water with waste heat.
9. Recover waste heat from exhaust air, flue gas, laundry, kitchen, engine exhaust, condenser, cooling tower.
10. Convert to radiant heat.
11. Reduce temperature during regular occupied time (20-21^{o}C)
12. Setback temperature during unoccupied time (15-18^{o}C)
13. Install de-stratification fans to reduce air stratification temperature

Cooling (operating times and temperatures)

1. Replace inefficient chillers.
2. Install package unit air conditioners for specific load requirements.
3. Install economizer cycles.
4. Utilize evaporative/dehumidification cooling.
5. Manifold chillers in parallel and sequence.
6. Isolate off-line chillers and cooling towers.
7. Replace air-cooled condensers with cooling towers.
8. Install heat pipe heat recovery unit.
9. Install plate and frame heat exchanger.
10. Convert mechanical chiller to absorption.
11. Ensure coils and heat exchangers are kept clean
12. Increase temperature during regular occupied time (22-24^{o}C)
13. Allow higher temperatures during unoccupied time (24-26^{o}C)

Ventilation Distribution (3rs)

1. Slow fans down to reduce air flow
2. Reduce air stratification.
3. Convert to variable air volume.
4. Insulate pipe and ductwork.
5. Install automatic dampers.
6. Consider zoning modifications.
7. Reduce outside air percentage. Use ASHRAE guidelines of 20 cfm per person
8. Shut off /reduce heat to lobbies, stairwells, hallways.
9. Reduce/eliminate air to unoccupied areas.

10. Utilize outside air for free cooling.
11. Eliminate simultaneous heating and cooling.
12. Ensure exhaust fans are turned off when supply fans are turned off
13. Reduce hours of operation during unoccupied time
14. Ensure filters are clean
15. Ensure fresh are dampers are operating properly

Lighting (3rs)

1. Convert incandescent to fluorescent or high-Intensity discharge.
2. Replace incandescent lamps with compact fluorescents
3. Replace incandescent exit lamps with LED exit fixtures
4. Convert mercury vapor to metal halide or sodium vapor.
5. Modify fixtures (add reflectors, lower height). Employ task lighting.
6. Replace fluorescent lamps with T-8 lamps and electronic ballasts
7. Install occupancy sensors (infrared, ultrasonic).
8. Install time-of-day controls.
9. Install automatic daylight dimmers.
10. Install day lighting.
11. Install local switches.

Domestic Hot Water (3Rs)

1. Install low-flow showerheads.
2. Install low-flow faucets.
3. Install flow regulators
4. Install self-shutoff faucets.
5. Decentralize hot water heating.
6. Add piping and tank insulation.
7. Install booster heaters for hot water in lieu of central system use.

Kitchen

1. Install makeup air supply for exhaust
2. Install timer for exhaust
3. Install heat reclamation system for exhaust heat.

4. Add/improve insulation.

Utility Plant Systems

1. Reduce steam distribution pressure.
2. Increase boiler efficiency.
3. Insulate boiler piping.
4. Install economizers.
5. Install air preheaters.
6. Install blow down controls.
7. Modernize boiler and chiller controls.
8. Ensure steam traps are in good working order. Inspect annually.

Electrical Equipment (Reduce time and temperature)

1. Convert to energy efficient (EE) motors on burnout.
2. Install variable-speed motors.
3. Replace oversized motors with properly sized EE motors.
4. Install multi-speed motors.
5. De-energize equipment when not in use
6. Reduce loads when not required/ Reduce hours of operation
7. Install capacitors or synchronous motors to increase power factor.
8. Reduce transformer losses by proper loading and balancing.
9. Ensure drive belts have the proper tension

Controls (Reduce time and temperature)

1. Install temperature/pressure reset devices.
2. Install stop/start devices.
3. Install night setback devices.
4. Replace hand valves with automatic valves.

Car Plugs (Reduce operating time)

1. Cycle car plugs 50% off/ 50% on to save demand and energy.
2. Install timer to turn car plugs off when nor required
3. Install car plug management system.
