## PLNT4610/7690 BIOINFORMATICS

## FINAL EXAMINATION

Wednesday December 19, $2018 \quad$ 13:30 to 15:30 Agriculture 130
Answer any combination of questions totalling to exactly 100 points. The questions on this exam total to 120 points. If you answer questions totalling more than 100 points, answers will be discarded at random until the total points equal 100 . This exam is worth $20 \%$ of the course grade.

Hand in the question sheets along with your exam booklet. All questions must be answered in the exam book. The question sheets will be shredded after the exam.

#### Abstract

Ways to write a readable and concise answer: i. Just answer the question. Save time by specifically addressing what is asked. Don't give irrelevant background if it doesn't contribute to the question that was asked. ii. Avoid stream of consciousness. Plan your answer by organizing your key points, and then write a concise, coherent answer. Make your point once, clearly, rather than repeating the same thing several times with no new information. iii. Point form, diagrams, tables, bar graphs, figures are welcome. Often they get the point across more clearly than a long paragraph. iv. Your writing must be legible. If I can't read it, I can't give you any credit.

1. (5 points) Before constructing libraries for RNAseq transcriptomics experiments, RNA samples are purified on an oligo-dT column to eliminate rRNA, resulting in purified mRNA. What would be the problem with measuring gene expression, if this step were omitted?
2. (10 points) A multiple sequence alignment is shown for five DNA sequences, each 13 nt long. When considering construction of a phylogenetic tree, which positions are the most informative? Which positions are the least informative. Explain your reasoning.
10
Alpha/1AACGTGGCCACAT
Beta/1-AAGGTCGCCACAC
GammaCAGTTCGCCACAA
Delta/l-GAGATTTCCGCCT
Epsilon/GAGATCTCCGCCC
3. (5 points) In a $\qquad$ a $\qquad$ database, all data are represented in records, forcing the data into the structure of a single data type. In a relational database, all data are organized into
$\qquad$
b $\qquad$ . Links between tables are referred to as $\qquad$ c and $\qquad$ e $\qquad$ .
4. (10 points) Using the accompanying figure as a guide, describe how the Pollux algorithm finds errors in sequencing reads and corrects them.

5. (10 points) In RNAseq experiments, gene expression is typically calculated by the equation

FPKM (Fragments Per Kilobase per Million mapped fragments) = F/CN
Expression of two genes was measured as follows

|  | control cells <br> (5 million mapped fragments) | hormone-treated cells <br> (7 million mapped fragments) |
| :--- | :---: | :---: |
|  | number of fragments | number of fragments |
| geneA (length $=1.8 \mathrm{~kb}$ ) | 15,000 | 20,000 |
| geneB (length $=5 \mathrm{~kb}$ ) | 8000 | 11,000 |

a) Calculate the FPKM values for genes A and B in control and hormone-treated cells. In a table similar to the one below, show the calculations and the FPKM values.

|  | FPKM |  |
| :--- | :---: | :---: |
|  | control | hormone-treated cells |
| geneA |  |  |
| geneB |  |  |

b) What do these results tell you about the response of genes A and B to hormone treatment?
6. (5 points) In RNAseq experiments, when deciding whether genes are differentially expressed between two conditions, what is the distinction between the Power of the statistical test, and the False Discovery Rate?
7. (10 points) In class we talked about two examples of client/server programs: NCBI BLAST, and the Jmol 3D protein structure viewer at the PDB web site. Screenshots for each are shown below. Both use the client-server model, in which some steps of the task run on the user's compter, and some run on the server. In each case, describe which of the major steps run on the user's computer, and which steps are run on the server. Explain the reason for why these steps are allocated to either the client or server, in each of the two cases.

## NCBI BLAST

8. (10 points) For $\mathbf{n}$ sequences, the number of possible tree topologies is given in the table.
a) In principle, one could construct phylogenies using an exhaustive algorithm that considered every possible tree topology. How much more computing time would it take to calculate a phylogeny for 50 sequences, compared to 10 sequences?
b) Suppose that you had access to a High

Performance Computer cluster with 100,000 CPUs. Discuss whether or not that HPC cluster could be used for performing exhaustive phylogenetic analysis. Put another way, to what extent would the speedup from 100,000 CPUs help for these types of problems? Show calculations to support your conclusions.

| \# of sequences <br> $\mathbf{n}$ | $\prod_{\mathrm{i}=3}^{\mathrm{n}} \quad(2 \mathrm{i}-5)$ |
| :---: | :---: |
|  | 1 |
| 4 | 3 |
| 5 | 15 |
| 6 | 105 |
| 7 | 945 |
| 8 | 10,395 |
| 9 | 135,135 |
| 10 | $2,027,025$ |
| 50 | $2.8 \times 10^{74}$ |

9. (10 points) In your exam booklet, create a table similar to the one below, and fill in the appropriate values eg. faster or slower, yes or no. For the example in c), give the name of one distance method, and one character method.

|  | Phylogenetic Method |  |
| :--- | :--- | :--- |
|  | Distance | Character |
| a) speed (faster/slower) |  |  |
| b) accuracy <br> (more accurate/less accurate) |  |  |
| c) example <br> (name of method) |  |  |
| d) can detect homoplasies <br> (yes/no) |  |  |
| e) can reconstruct ancestral <br> sequences (yes/no) |  |  |

10. (10 points) The main goal of genome annotation is to create models of features in a genome. In particular, annotation pipelines try to create "gene models" for each gene in the genome.
a) Briefly describe the types of information annotation pipelines use to create gene models,
b) Briefly describe what information a gene model contains.
11. (10 points) Volcano plots show, for every gene, the log of the fold change between two conditions or treatments on the X -axis, and the log of the p value on the Y axis. In other words, the X -axis shows the degree to which the expression of that gene has either increased or decreased between the two treatments, and the Y axis shows how significant the change is for that gene, based on the change seen in different replicates for that gene.

What is different about the two experiments shown in Fig. 1 and Fig. 2 below?

Figure 1

Figure2
12. (5 points) A series of random DNA sequences was constructed, each with a different percentage of AT bases. and sequences were compared using several phylogeny methods. In each case, 100 bootstrap replicates were done. The results are presented in the table below.

Consider the parsimony tree. Explain why the sequences group as they do in this tree.
13. (10 points) In order to get the best possible genome assembly for the fungus Rhodosporidium toruloides, the same set of sequencing reads were assembled several times using different assembly programs. Two of the assemblies are shown below. Which is the better assembly for this genome? Cite evidence to support your conclusion

| Rhodosporidium toruloides genome assemblies |  |  |  |
| :---: | :---: | :---: | :---: |
| SRR516824 |  | SRR516830 |  |
| Assembly | contigs | Assembly | contigs |
| \# contigs (>= 0 bp ) | 2056 | \# contigs (>= 0 bp) | 2930 |
| \# contigs (>= 1000 bp ) | 610 | \# contigs (>= 1000 bp ) | 2155 |
| \# contigs (>= 5000 bp ) | 374 | \# contigs (>= 5000 bp ) | 1247 |
| \# contigs (>= 10000 bp ) | 318 | \# contigs (>= 10000 bp ) | 707 |
| \# contigs (>= 25000 bp ) | 231 | \# contigs (>= 25000 bp ) | 143 |
| \# contigs (>= 50000 bp ) | 139 | \# contigs (>= 50000 bp ) | 8 |
| Total length ( $>=0 \mathrm{bp}$ ) | 20261352 | Total length (>= 0 bp ) | 20156200 |
| Total length (>= 1000 bp ) | 19959191 | Total length ( $>=1000 \mathrm{bp}$ ) | 19822018 |
| Total length (>= 5000 bp ) | 19440025 | Total length (>= 5000 bp ) | 17409372 |
| Total length (>= 10000 bp ) | 19020132 | Total length (>= 10000 bp ) | 13480241 |
| Total length (>= 25000 bp ) | 17590721 | Total length (>= 25000 bp ) | 4804497 |
| Total length (>= 50000 bp ) | 14282511 | Total length (>= 50000 bp ) | 477339 |
| \# contigs | 790 | \# contigs | 2452 |
| Largest contig | 538739 | Largest contig | 69119 |
| Total length | 20084923 | Total length | 20037245 |
| GC (\%) | 61.95 | GC (\%) | 61.85 |
| N50 | 80570 | N50 | 14509 |
| N75 | 44935 | N75 | 8031 |
| L50 | 71 | L50 | 423 |
| L75 | 156 | L75 | 880 |

14. (10 points) Databases turn data into knowledge. Using the example at right, describe how this database turns data into knowledge. Make sure to use precise terminology associated with databases in your description.

Note: The Type field enumerates the host response to the pathogen, in this case Pattern Triggered Immunity.
